

ABSTRACT

5       An entertainment system for use in a water environment is disclosed. The system preferably comprises an MP3 player unit that is housed in a water resistant housing and water resistant speaker units with sealed membrane transducers configured to be placed on and secured to bony portions of a user's head to transmit sound therefrom. The entertainment system also preferably comprises an input means, such as a USB port, for transmitting MP3 files to a memory unit from one or more media data sources, such as a network, a computer or a hard drive.
